

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1-15. (Canceled)

16. (Currently Amended) A knee joint prosthesis for implantation in a knee joint that connects a femur and a tibia, the tibia having a tibial axis, comprising:

a tibial component comprising an upper surface, a post extending from the upper surface in a direction extending generally upwardly from the upper surface, the post having a post bearing surface~~a tibial bearing surface~~;

a femoral component comprising a medial condyle, a lateral condyle and a cam having a cam surface, wherein (i) the post bearing surface and the cam surface define a surface area of contact and (ii) the medial condyle and the lateral condyle are configured to act against the upper tibial bearing surface, and wherein, during flexing of the knee, and wherein the cam surface and the tibial bearing surface are configured to increase the surface area of contact between the femoral component and the tibial component increases when the knee flexes to a flex angle greater than 120°.

17. (Currently Amended) The knee joint prosthesis of claim 16, wherein ~~the tibial component comprises an upper surface and a post extending from the upper surface in a direction extending generally away from the upper surface, the upper surface tibial bearing surface further comprises a medial recess and~~ a lateral recess and a post bearing surface located on the post, and wherein the cam of the femoral component is ~~located between the medial condyle and the lateral condyle.~~

18. (Currently Amended) The knee joint prosthesis of claim 17, wherein the medial condyle is ~~configured to act~~ acts against the medial recess and the lateral condyle is ~~configured to act~~ acts against the lateral recess during flexing of the knee, and the cam surface and the post bearing surface ~~are configured to contact one another at a flex angle of about 90°.~~

19. (Currently Amended) The knee joint prosthesis of claim 18, wherein the cam surface and the post tibial-bearing surface are shaped and configured such that the contact surface area of contact between the cam surface and the tibial-bearing surface is approximately constant from a flex angle of about 90° to a flex angle of at least about 120°.

20. (Currently Amended) The knee joint prosthesis of claim 17, wherein the cam surface and the post bearing surface ~~are configured to contact one another at least at flex angles greater than 120°, and wherein, at a range of flex angles that are greater than 120°,~~ (i) the post bearing surface is ~~configured to be convex~~ when the post is viewed substantially along the tibial axis, and (ii) that portion of the cam surface that contacts the post bearing surface ~~at flex angles greater than 120° is configured to be~~ is concave when viewed substantially along the tibial axis.

21. (Currently Amended) The knee joint prosthesis of claim 20, wherein the cam surface and the post bearing surface ~~are configured to contact one another from a flex angle of about 90° to a flex angle of at least 150°.~~

22. (Currently Amended) The knee joint prosthesis of claim 20, wherein the ratio of the surface area of contact area between the post bearing surface and the cam surface when the flex angle is 150° to the surface area of contact area between the post bearing surface and the cam surface when the flex angle is about 90° is at least about 2.0.

23. (Currently Amended) The knee joint prosthesis of claim 20, wherein the ratio of the surface area of contact area between the post bearing surface and the cam surface when the flex angle of 145° to the surface area of contact area between the post bearing surface and the cam surface when the flex angle is about 90° is at least about 1.3.

24. (Currently Amended) The knee prosthesis of claim 20, wherein the surface area of contact between the post bearing surface and the cam surface when the flex angle is less than 120° is less than about 25 mm<sup>2</sup>.

25. (Previously Presented) The knee joint prosthesis of claim 17, wherein the medial condyle and the lateral condyle each have a posterior end, and the cam is located at or towards the posterior ends of the medial condyle and the lateral condyle.

26. (Previously Presented) The knee joint prosthesis of claim 17, wherein the cam is connected to and extends between the medial condyle and the lateral condyle.

27. (Previously Presented) The knee joint prosthesis of claim 17, wherein the cam has a generally bar-like shape.

28. (Previously Presented) The knee joint prosthesis of claim 17, wherein the cam has a generally round cross-section when viewed along the length of the cam.

29. (Currently Amended) The knee joint prosthesis of claim 28, wherein the round cross-section of the cam is ~~configured to be~~ interrupted in that region where the cam surface contacts the post bearing surface at flex angles greater than 120° so that, in the interrupted region, the cross-section is flattened or concave.

30. (Previously Presented) The knee joint prosthesis of claim 28, wherein the cross-section of the cam is rounded at and towards its ends, and flattened or concave in a central region between the ends of the cam where the cam surface contacts the post bearing surface at flex angles greater than 120°.

31. (Previously Presented) The knee joint prosthesis of claim 26, wherein the cam is formed integrally with a web that extends between the medial condyle and the lateral condyle, the web contacting the cam at a point where the cam does not contact the post during articulation of the joint.

32. (Previously Presented) The knee joint prosthesis of claim 20, wherein when the maximum area of the cam surface that contacts the post bearing surface extends to a point that is not more than 1.5 mm from the ends of the cam where the cam joins the condyles.

33. (Currently Amended) The knee joint prosthesis of claim 20, wherein the concavity of the cam surface is configured so that its concavity is greater in the region where the cam surface acts against the post bearing surface when the flex angle is at least about 130° than in the region where the cam surface acts against the post at flex angles lower than about 130°.

34. (Previously Presented) The knee joint prosthesis of claim 20, wherein the depth of the concave portion of the cam, measured relative to the surface of the cam at each side of the concave portion, is at least about 0.5 mm.

35. (Previously Presented) The knee joint prosthesis of claim 20, wherein the depth of the concave portion of the cam, measured relative to the surface of the cam at each side of the concave portion, is not more than 1.2 mm.

36. (Previously Presented) The knee joint prosthesis of claim 20, wherein the radius of curvature at the anterior edge of the concave portion is at least about 1.0 mm.

37. (Previously Presented) The knee joint prosthesis of claim 20, wherein the radius of curvature at the anterior edge of the concave portion is not more than about 3.0 mm.

38. (Previously Presented) The knee joint prosthesis of claim 20, wherein the radius of curvature at the anterior edge of the concave portion is not more than about 6.0 mm.

39. (Previously Presented) The knee joint prosthesis of claim 20, wherein the radius of curvature at the anterior edge of the concave region is at least about 3.0 mm.

40. (Currently Amended) A knee joint prosthesis for implantation in a knee joint that connects a femur and a tibia, the tibia having a tibial axis, comprising:

a tibial component comprising an upper surface, a post extending from the upper surface in a direction extending generally upwardly from the upper surface, the post having a post bearing surface-a tibial bearing surface;

a femoral component comprising a medial condyle, a lateral condyle and a cam having a cam surface, wherein (i) the post bearing surface and the cam surface define a surface area

~~of contact and (ii) the medial condyle and the lateral condyle are configured to contact the upper tibial-bearing surface, during flexing of the knee, and wherein the cam surface and the tibial-bearing surface are configured such that the surface area of contact between the cam surface and the tibial-bearing surface increases when the knee is flexed to an angle greater than 120°.~~

41. (Currently Amended) The knee joint prosthesis of claim 40, wherein the ratio of the surface area of contact area between the tibial-bearing surface and the cam surface when the flex angle is 150° to the surface area of contact area between the tibial-bearing surface and the cam surface when the flex angle is about 90° is at least about 2.0.

42. (Currently Amended) The knee joint prosthesis of claim 40, wherein the ratio of the surface area of contact area between the tibial-bearing surface and the cam surface when the flex angle of 145° to the surface area of contact area between the tibial-bearing surface and the cam surface when the flex angle is about 90° is at least about 1.3.

43. (Currently Amended) The knee joint prosthesis of claim 40, wherein the cam surface and the ~~post~~ tibial-bearing surface are shaped ~~configured~~ such that the ~~contact surface area of contact between the cam surface and the tibial-bearing surface~~ is approximately constant from a flex angle of about 90° to a flex angle of at least about 120°.

44. (Currently Amended) The knee joint prosthesis of claim 40, wherein the tibial component comprises an upper surface and a post extending from the upper surface in a direction extending generally upwardly away from the upper surface, the tibial component further bearing surface comprises a medial recess and a lateral recess, ~~and a post bearing surface located on the post~~, the cam surface and the post bearing surface ~~are configured to contact one another at least at flex angles greater than 120°, and wherein, at a range of flex angles that are greater than 120°, (i) the post bearing surface is configured to be convex when the post is viewed substantially along the tibial axis, and (ii) that portion of the cam surface that contacts the post bearing surface at flex angles greater than 120° is configured to be concave when viewed substantially along the tibial axis.~~

45. (Currently Amended) The knee joint prosthesis of claim 44, wherein the cam surface and the post bearing surface ~~are configured to contact one another from a flex angle of about 90° to a flex angle of at least 150°.~~

46. (Currently Amended) The knee joint prosthesis of claim 40, wherein the tibial component comprises ~~an upper surface and a post extending from the upper surface in a direction extending generally away from the upper surface, the tibial bearing surface comprises a medial recess and a lateral recess, and a post bearing surface located on the post,~~ and wherein the cam of the femoral component is ~~located between the medial condyle and the lateral condyle.~~
